Note. *** = $p < .001$, ** = $p < .01$, * = $p < .05$, ns = not significant. A higher score on the well-being index (0 to 100) corresponds to higher levels of subjective overall well-being. A higher score on the total recidivism risk score (0 to 42) corresponds to higher levels of recidivism risk. A higher score on the primary goods dissatisfaction score (20 to 100) corresponds to lower levels of satisfaction (i.e., more dissatisfaction). A higher score on the mean treatment motivation score (0 to 2) corresponds to higher levels of motivation. A higher score on the internalizing and externalizing subscales (0 to 20) corresponds to more problems.
